splunk Search command cheatsheet

Miscellaneous

The iplocation command in this case will never be run on remote peers. All events from remote peers from the initial search for the terms FOO and BAR will be forwarded to the search head where the iplocation command will be run.

Administrative

View information in the "audit" index.	index=audit audit
Crawl root and home directories and add all possible inputs found (adds configuration information to "inputs.conf").	crawl root="/;/Users/" input add
Display a chart with the span size of 1 day.	dbinspect index=_internal span=1d
Return the values of "host" for events in the "_internal" index.	metadata type=hosts index=_internal
Return typeahead information for sources in the "_internal" index.	typeahead prefix=source count=10 index=_internal

Alerting

Send search results to the specified email. ... | sendemail to="elvis@splunk.com"

Fields

add

Save the running total of "count" in a field called "total_count".	accum count AS total_count
Add information about the search to each event.	addinfo
Search for "404" events and append the fields in each event to the previous search results.	appendcols [search 404]
For each event where 'count' exists, compute the difference between count and its previous value and store the result in 'countdiff'.	delta count AS countdiff
Extracts out values like "7/01", putting them into the "monthday" attribute.	erex monthday examples="7/01"
Set velocity to distance / time.	eval velocity=distance/time
Extract field/value pairs and reload field extraction settings from disk.	extract reload=true

Extract field/value pairs that are delimited by " ;", and values of fields that are delimited by "=:".	<pre> extract pairdelim=" ;", kvdelim="=:", auto=f</pre>
Add location information (based on IP address).	iplocation
Extract values from "eventtype.form" if the file exists.	kvform field=eventtype
Extract the "COMMAND" field when it occurs in rows that contain "splunkd".	multikv fields COMMAND filter splunkd
Set RANGE to "green" if the date_second is between 1-30; "blue", if between 31-39; "red", if between 40-59; and "gray", if no range matches (e.g. "0").	rangemap field=date_second green=1-30 blue=31-39 red=40-59 default=gray
Calculate the relevancy of the search and sort the results in descending order.	disk error relevancy sort -relevancy
Extract "from" and "to" fields using regular expressions. If a raw event contains "From: Susan To: Bob", then from=Susan and to=Bob.	rex field=_raw "From: (? <from>.*) To: (?<to>.*)"</to></from>
Add the field: "combolP". Values of "combolP" = ""sourcelP" + "/" + "destlP"".	strcat sourceIP "/" destIP comboIP
Extract field/value pairs from XML formatted data. "xmlkv" automatically extracts values between XML tags.	xmlkv
Convert every field value to a number value except for values in the field "foo" (use the "none" argument to specify fields to ignore).	convert auto(*) none(foo)
Change all memory values in the "virt" field to Kilobytes.	convert memk(virt)
Change the sendmail syslog duration format (D+HH:MM:SS) to seconds. For example, if "delay="00:10:15"", the resulting value will be "delay="615"".	convert dur2sec(delay)
Convert values of the "duration" field into number value by removing string values in the field value. For example, if "duration="212 sec"", the resulting value will be "duration="212"".	convert rmunit(duration)
Separate the value of "foo" into multiple values.	makemv delim=":" allowempty=t foo
For sendmail events, combine the values of the senders field into a single value; then, display the top 10 values.	eventtype="sendmail" nomv senders top senders
Keep only the "host" and "ip" fields, and display them in the order: "host", "ip".	fields host, ip

convert

filter

modify

Compute the necessary information to later do 'chart avg(foo) by bar' on summary indexed results.	sichart avg(foo) by bar
Compute the necessary information to later do 'rare foo bar' on summary indexed results.	sirare foo bar
Compute the necessary information to later do 'stats avg(foo) by bar' on summary indexed results	sistats avg(foo) by bar
Compute the necessary information to later do 'timechart avg(foo) by bar' on summary indexed results.	sitimechart avg(foo) by bar
Compute the necessary information to later do 'top foo bar' on summary indexed results.	sitop foo bar

Reporting

Calculate the sums of the numeric fields of each result, and put the sums in the field "sum".	addtotals fieldname=sum
Analyze the numerical fields to predict the value of "is_activated".	af classfield=is_activated
Return events with uncommon values.	anomalousvalue action=filter pthresh=0.02
Return results associated with each other (that have at least 3 references to each other).	associate supcnt=3
For each event, copy the 2nd, 3rd, 4th, and 5th previous values of the 'count' field into the respective fields 'count_p2', 'count_p3', 'count_p4', and 'count_p5'.	autoregress count p=2-5
Bucket search results into 10 bins, and return the count of raw events for each bucket.	bucket size bins=10 stats count(_raw) by size
Return the average "thruput" of each "host" for each 5 minute time span.	bucket _time span=5m stats avg(thruput) by _time host
Return the average (mean) "size" for each distinct "host".	chart avg(size) by host
Return the the maximum "delay" by "size", where "size" is broken down into a maximum of 10 equal sized buckets.	chart max(delay) by size bins=10
Return the ratio of the average (mean) "size" to the maximum "delay" for each distinct "host" and "user" pair.	chart eval(avg(size)/max(delay)) by host user
Return max(delay) for each value of foo split by the value of bar.	chart max(delay) over foo by bar
Return max(delay) for each value of foo.	chart max(delay) over foo
Build a contingency table of "datafields" from all events.	contingency datafield1 datafield2 maxrows=5 maxcols=5 usetotal=1
Calculate the co-occurrence correlation between all fields.	correlate type=cocur
Return the number of events in the '_internal' index.	eventcount index=_internal

Compute the overall average duration and add 'avgdur' as a new field to each event where the 'duration' field exists	eventstats avg(duration) as avgdur
Make "_time" continuous with a span of 10 minutes.	makecontinuous _time span=10m
Remove all outlying numerical values.	outlier
Return the least common values of the "url" field.	rare url
Remove duplicates of results with the same "host" value and return the total count of the remaining results.	stats dc(host)
Return the average for each hour, of any unique field that ends with the string "lay" (for example, delay, xdelay, relay, etc).	stats avg(*lay) BY date_hour
Search the access logs, and return the number of hits from the top 100 values of "referer_domain".	<pre>sourcetype=access_combined top limit=100 referer_domain stats sum(count)</pre>
For each event, add a count field that represent the number of event seen so far (including that event). i.e., 1 for the first event, 2 for the second, 3, 4 and so on	streamstats count
Graph the average "thruput" of hosts over time.	timechart span=5m avg(thruput) by host
Create a timechart of average "cpu_seconds" by "host", and remove data (outlying values) that may distort the timechart's axis.	timechart avg(cpu_seconds) by host outlier action=tf
Calculate the average value of "CPU" each minute for each "host".	timechart span=1m avg(CPU) by host
Create a timechart of the count of from "web" sources by "host"	timechart count by host
Compute the product of the average "CPU" and average "MEM" each minute for each "host"	timechart span=1m eval(avg(CPU) * avg(MEM)) by host
Return the 20 most common values of the "url" field.	top limit=20 url
Computes a 5 event simple moving average for field 'foo' and write to new field 'smoothed_foo'	trendline sma5(foo) as smoothed_foo ema10(bar)
also computes N=10 exponential moving average for field 'bar' and write to field 'ema10(bar)'.	
Reformat the search results.	timechart avg(delay) by host untable _time host avg_delay
Reformat the search results.	xyseries delay host_type host

Results

append

	Append the current results with the tabular results of "fubar".	chart count by bar append [search fubar chart count by baz]
	Joins previous result set with results from 'search foo', on the id field.	join id [search foo]
filter		
	Return only anomalous events.	anomalies
	Remove duplicates of results with the same host value.	dedup host
	Combine the values of "foo" with ":" delimiter.	mvcombine delim=":" foo
	Keep only search results whose "_raw" field contains IP addresses in the non-routable class A (10.0.0.0/8).	regex _raw="(? \d)10.\d{1,3}\.\d{1,3}\.\d{1,3}(?!\d)"</th
	Join results with itself on 'id' field.	selfjoin id
	For the current search, keep only unique results.	uniq
	Return "physicjobs" events with a speed is greater than 100.	sourcetype=physicsobjs where distance/time > 100
genera	te	
	All daily time ranges from oct 25 till today	gentimes start=10/25/07
	Loads the events that were generated by the search job with id=1233886270.2	loadjob 1233886270.2 events=t
	Create new events for each value of multi-value field, "foo".	mvexpand foo
	Run the "mysecurityquery" saved search.	savedsearch mysecurityquery
group		
	Cluster events together, sort them by their "cluster_count" values, and then return the 20 largest clusters (in data size).	cluster t=0.9 showcount=true sort - cluster_count head 20
	Group search results into 4 clusters based on the values of the "date_hour" and "date_minute" fields.	kmeans k=4 date_hour date_minute
	Group search results that have the same "host" and "cookie", occur within 30 seconds of each other, and do not have a pause greater than 5 seconds between each event into a transaction.	transaction host cookie maxspan=30s maxpause=5s
	Have Splunk automatically discover and apply event types to search results	typelearner
	Force Splunk to apply event types that you have configured (Splunk Web automatically does this when you view the "eventtype" field).	typer

\mathbf{a}	rd	۵	r
u	ıu	C	

uei		
	Return the first 20 results.	head 20
	Reverse the order of a result set.	reverse
	Sort results by "ip" value in ascending order and then by "url" value in descending order.	sort ip, -url
	Return the last 20 results (in reverse order).	tail 20
ead		
	Display events from the file "messages.1" as if the events were indexed in Splunk.	file /var/log/messages.1
	Read in results from the CSV file: "\$SPLUNK_HOME/var/run/splunk/all.csv", keep any that contain the string "error", and save the results to the file: "\$SPLUNK_HOME/var/run/splunk/error.csv"	inputcsv all.csv search error outputcsv errors.csv
	Read in "users.csv" lookup file (under \$SPLUNK_HOME/etc/system/lookups or \$SPLUNK_HOME/etc/apps/*/lookups).	inputlookup users.csv
rite		
	Output search results to the CSV file 'mysearch.csv'.	outputcsv mysearch
	Write to "users.csv" lookup file (under \$SPLUNK_HOME/etc/system/lookups or \$SPLUNK_HOME/etc/apps/*/lookups).	outputlookup users.csv
earch		
xternal		
	Run the Python script "myscript" with arguments, myarg1 and myarg2; then, email the results.	<pre> script python myscript myarg1 myarg2 sendemail to=david@splunk.com</pre>
search		
	Keep only search results that have the specified "src" or "dst" values.	src="10.9.165.*" OR dst="10.9.165.8"
ubsear	ch	
	Get top 2 results and create a search from their host, source and sourcetype, resulting in a single search result with a _query field: _query=(("host::mylaptop" AND "sourcetype::pyslog") OR ("host::mylaptop" AND "sourcetype::myslog") OR ("host::mylaptop") OR ("host::	head 2 fields source, sourcetype, host format

"source::syslog.log" AND "sourcetype::syslog") OR ("host::bobslaptop" AND

"source::bob-syslog.log" AND "sourcetype::syslog"))	
Search the time range of each previous result for "failure".	<pre> localize maxpause=5m map search="search failure starttimeu=\$starttime\$ endtimeu=\$endtime\$"</pre>
Return values of "URL" that contain the string "404" or "303" but not both.	set diff [search 404 fields url] [search 303 fields url]
